

This is how we can access the summary list report from our EMR.

Summary List:

In Epic, open the Hospital Chart for your patient. You will be directed to select an encounter for your patient where you will select the patient's hospital encounter. On left side of the screen, and with proper clinical access, there will be a tab called Patient Summary. This tab is used primarily for clinical reporting. Using the Report field at the top right of this screen, enter the report name: Patient Summary List. The report will run and populate with the desired information. This report will include the patient's problem list, medication list, allergy information and any operative or procedural information. As the information in Epic is updated in any of these areas, the report information will update as well. A user can simply re-run the report to pull the most recent information for the patient.
